

Proposed Solution

HealHub Design Proposal

Project	HealHub
Tagline	Care At Your Fingertips
Domain	Healthcare / Doctor Appointment Booking
Stack	MERN Stack
Generated On	13 June 2026

Solution Overview

HealHub is a full-stack healthcare appointment booking platform created using the MERN stack. The system enables patients to search doctors, register, login, book appointments, and view appointment status, while doctors can register, login, view their dashboard, and manage patient appointment requests.

The application was developed with a practical internship submission goal: a working deployed model with cloud database connectivity, live frontend, live backend, and role-based user flows for patients and doctors.

Key Features

- Modern landing page with healthcare branding.
- Phone and password based login.
- Separate patient and doctor registration.
- Backend doctors displayed on Doctors page.
- Appointment booking workflow.
- Patient dashboard and doctor dashboard.
- Cloud deployment using Vercel and Render.

User Flow

Flow	Steps
Patient Flow	Home -> Register/Login -> Doctors -> Book Appointment -> Patient Dashboard
Doctor Flow	Home -> Doctor Register/Login -> Doctor Dashboard -> Appointment Requests
Data Flow	React UI -> API request -> Express route -> Mongoose model -> MongoDB Atlas
